Date: Sept. 20, 2026

ONLINE ACTIVITY #2
Personalized Linux, and Git Cheat Sheet

Using any available resources (official Git documentation, online tutorials, or the built-in git --help command), research the following topics and create a personalized 1-page (A4) cheat sheet:

1. Basic Linux commands (command, sample usage) (at least 10)
2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags

git init	git restore
git status	git branch
git add	git checkout / git switch
git commit	git merge
git log	git tag
git diff	git clone

3. the three-tree architecture of Git

You are free to use any design or color scheme, just make sure it is readable.

Submission:

1. Use PDF as the file format for your cheat sheet.
2. Upload it to your GitHub repository
3. Submit the link here: <https://drive.google.com/drive/folders/1-Y6e6E6PoLyGgB0WZ8prRCNfolpV3cj0?usp=sharing>

Reminders:

Please put a "Reference" section in the cheat sheet for the materials you cited.

I DO NOT PROHIBIT the use of AI for this activity, but please declare the extent of the use.

Sample:

"The author used [Tool Name, Version] to [specific task] during assignment preparation. The author reviewed and edited the content as needed and takes full responsibility for the final content of the work."

Or

"I have not used any AI or AI-assisted technologies to prepare this work."

pwd – Print working directory
ls – List directory contents
cd – Change directory
mkdir – Create a new directory.
rmdir – Remove an empty directory.
touch – Create an empty file or update its timestamp.
Cp – Copy files or directories
mv – Move or rename files or directories.
rm – Delete a file
cat - concatenate

git init - initialize an existing directory as a Git repository
git status - show modified files in working directory, staged for your next commit
git add - add a file as it looks now to your next commit (stage)
git commit - commit your staged content as a new commit snapshot
git log - show the commit history for the currently active branch
git diff - diff of what is changed but not stage
git restore - use to undo changes to files or remove files from the staging area
git branch - create a new branch at the current commit
git checkout / git switch - switch to another branch and check it out into your working directory
git merge - merge the specified branch's history into the current o
git tag - used to give a permanent, easy-to-remember name to a specific commit, usually to mark a release or important version.
git clone - retrieve an entire repository from a hosted location via URL

1. The Working Directory (or Working Tree)

- The actual files stored on computer that you can view and modify using a file manager or code editor. It serves as your workspace or sandbox, where you make changes to your project. Git detects these changes and marks files as modified **or** untracked until you stage or commit them.

2. The Staging Area (The Index)

- A single, hidden binary file located at `.git/index` that acts as a preparation area. When you run `git add`, you take a snapshot of the current state of your files in the working directory and save them to the Staging Area.

3. The Repository (HEAD / Git Directory)

- The stored hidden database `.git/objects` where Git saves all your project data. It is the project's history book. When you run `git commit`, Git saves a permanent snapshot of your staged files. The HEAD pointer just shows which snapshot you are currently looking at.

Link that assisted me in git commands <https://education.github.com/git-cheat-sheet-education.pdf> and I use google to search the definition of the linux commands and the three-tree architecture of Git.
